The eye has a type of cone cells which has sensitivity
peak at a different wavelength than the rods, usually referred
to as the "day" or "cone" vision. The rods are referred to as
"night" or "rod" vision. The rods are more sensitive to light than
the cones and are more numerous.

The receptors sensitivity range from up to 1000 times as sensitive as the eye. The visual range is approximately 1000 times as wide as the eye. The visual range is approximately 1000 times as wide as the eye.

It is very important to note that the report
states that the data is not representative of the
population. The data is only for the 1990s and
does not include the 2000s. This is a significant
limitation of the study. The data is also not
representative of the population. The data is only
for the 1990s and does not include the 2000s.
This is a significant limitation of the study.
The data is also not representative of the population.
